A Partnership between the Northern Ohio Energy Storage Community, DOE and National Laboratories

A REVIEW OF ENERGY STORAGE TECHNOLOGIES FOR AUTOMOTIVE APPLICATIONS

Kenneth P. Dudek, PhD

Northern Ohio Energy Storage and Integration Workshop

A Partnership between the Northern Ohio Energy Storage Community, DOE and National Laboratories

Kenneth P. Dudek, PhD

- **CEO and Founder of CAR Technologies LLC**
- **Adjunct CAR Fellow at the Ohio State University/Center for Automotive Research**
- **25-year General Motors R&D & Powertrain**
- **Boss Kettering Award Winner**
- **Over 30 patents in controls arena**
- **B.S, M.S., PhD Electrical Engineering
Notre Dame University**

Robert P. Lane, MBA

- **EVP and Founder of CAR Technologies LLC**
- **16-year Automotive Industry Consulting and Engineering Services – Alternative Fuel Vehicles**
- **2009 Responsible for \$278M of the \$1.4B of ARRA Grant Activity (20%)**
 - **Cell and Pack Manufacturing**
 - **Commercial Vehicle Electrification**
 - **Fuel Efficient Components (hybrid transmissions)**
- **Launched CAR Technologies in 2009**
- **B.S. University of Tennessee, MBA Emory University**

Northern Ohio Energy Storage and Integration Workshop

A Partnership between the Northern Ohio Energy Storage Community, DOE and National Laboratories

- **CAR Technologies LLC**
 - Facilities construction started in 2010
 - Tier 1 to Vehicle and Battery OEMs
 - Characterization, Performance, and Durability Testing
 - Cell, Module and Pack FMEA
 - Battery Management Systems (HW, SW, Algorithms)
- **Columbus, OH Lab**
 - 120 channel of 0-8V, 400 amp cell cycling
 - 10 mA, 10 mV measurement accuracy
 - 10 channels of pack cycling
 - Wet labs; High temperature water baths
 - Electron Microscopy; X-ray Diffraction on site
- **Coming to Warren, OH**
 - TBEIC partner

Northern Ohio Energy Storage and Integration Workshop

“Currently Lead Acid Dominates Automotive Energy Storage” (Lithium Ion Coming On Strong)

Northern Ohio Energy Storage and Integration Workshop

A Partnership between the Northern Ohio Energy Storage Community, DOE and National Laboratories

Adoption of Energy Storage in the Automotive Industry

Drivers

- Regulatory/Policy
 - CAFE Standards
 - CARB
 - Carbon Markets?
- Experience with Energy Storage Manufacturers
- Incentives
 - For now
- Risk vs. **Reward**
 - Emission free (kind of)
 - Electric propulsion can have awesome vehicle performance

Barriers

- Consumer adoption rates
 - COST!!
 - Range Anxiety (=COST)
- Manufacturing flexibility & infrastructure
 - Motors vs. IC-based Powertrains
- Development time for new vehicles (50-84 months)
- Penetration of 12V infrastructure in vehicle
- **Risk vs. Reward**
 - Large, additional development costs (over too few units)
 - Warranty

Challenge for traditional large format cells

Fast Charge

-20 °C Operation

Northern Ohio Energy Storage and Integration Workshop

A Partnership between the Northern Ohio Energy Storage Community, DOE and National Laboratories

Current Energy Storage Gaps - **PbA**

Priority areas for improving performance:

- **Higher cycle life**
- **Higher power density**
- **Better charge acceptance**
- **Lower battery weight**

Vocational Needs

- Start-stop with voltage stabilization system, potentially including lead-based AGM battery with supercapacitors
- Engine off while approaching a stop, but at vehicle speed <20 km/h (not only after complete vehicle standstill as today)
- “Stop-in-motion”: Engine off at higher speeds whenever acceleration is not needed.

R&D Efforts - **PbA**

- **Battery manufacturers are currently working to implement the following general improvements:**
 - **Carbon nanotechnologies** – developing new types of additives to improve the conductivity of active materials
 - **High surface area doping materials** – increasing charge acceptance while avoiding hydrogen evolution (gassing)
 - **Low-cost catalysts** – recombining hydrogen and oxygen produced at regenerative brake events
 - **Light-weighting solutions** – developing new designs and materials

Northern Ohio Energy Storage and Integration Workshop

A Partnership between the Northern Ohio Energy Storage Community, DOE and National Laboratories

Current Energy Storage Gaps – **Lithium ion**

Priority areas for improved performance:

- **Reduced cost at battery pack level**
- **Increased energy and power density**
- **Improved battery lifetime**
- **Increased charge acceptance**
- **Better performance at cold (and hot)**

Vocational Needs

- Lithium-ion batteries will be used in advanced micro-hybrid and mild-hybrid vehicles.
- Lithium-ion batteries will be implemented in 48V dual battery systems together with a 12V lead-based battery
- Hybrid system (even 48V) support chassis systems, air conditioning compressors, and regenerative braking and more.

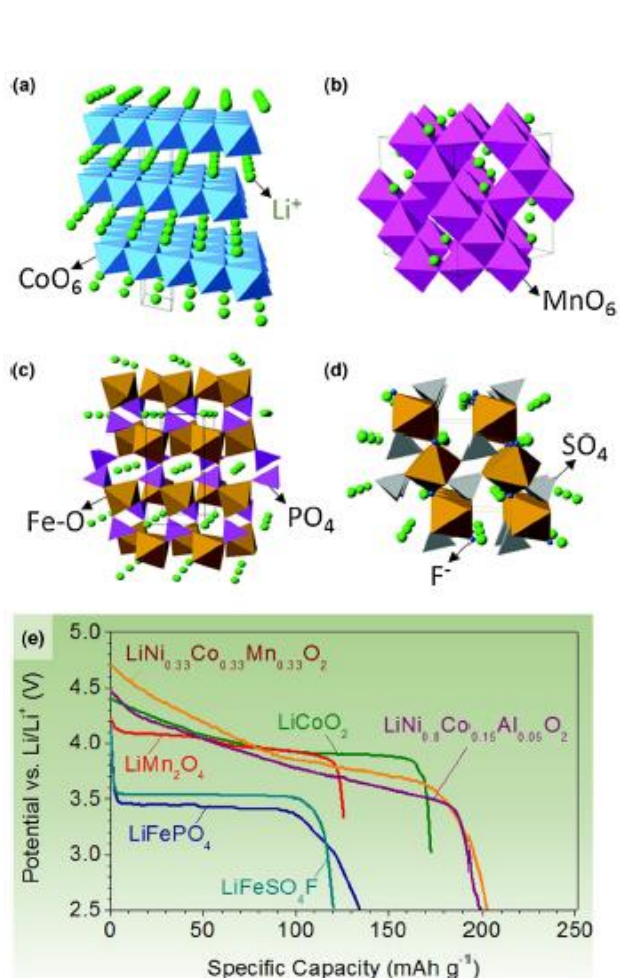

Current Engineering Efforts – **Lithium ion**

- **Performance and Cost - a materials play**
 - Improvement of cell materials and components
 - Anode, Cathode, Separator, Electrolyte
 - Lower cost cell mechanical design
 - Improvement of materials properties
 - Scaling up in production of large cell formats

Northern Ohio Energy Storage and Integration Workshop

Northern Ohio Energy Storage and Integration Workshop

A Partnership between the Northern Ohio Energy Storage Community, DOE and National Laboratories

Mid-Term R&D Efforts – **Lithium ion**

- **Silicon Anode Batteries**
 - Challenges: Volumetric fluctuations, cracking, poor cycle life
- **Lithium Sulphur**
 - Challenges: High mechanical stress, unwanted reaction with electrolytes, nonlinear discharge and charge response
- **Solid State (thin film) Batteries**
 - Challenges: Difficulty getting high current across solid-state interfaces
- **Lithium Capacitors**
 - Challenges: Self-discharge, energy density, thermal design
- **Lithium Air Batteries**
 - Challenges: Limited by the oxygen evolution and oxygen reduction kinetics, especially oxygen evolution
- **Magnesium (anode) Batteries**
 - Challenges: Chemistry involved in making a magnesium-ion battery work efficiently has yet to be perfected (some promising work)

Current Engineering Efforts – **Lithium ion**

- **Systems integration (pack)**
 - Progress is being made in optimization and standardization of mechanical designs
 - Better understanding of Battery Management System (BMS) functions, components and interfaces
 - More advanced Thermal Management systems
 - Improve range of operating conditions
 - Reduce system complexity

Current Engineering Efforts – **Lithium ion**

- **Safety**
 - Efficient and **high fidelity state-of-function monitoring** techniques
 - Advanced **state-of-charge/ state-of-health** indicators
 - Cell diagnostic and supervision systems to support the **lifecycle management of ageing**
 - Realistic standards for **abuse tolerance** are being released
 - Need the concomitant improvements to the **robustness of cell and pack design**

Northern Ohio Energy Storage and Integration Workshop

A Partnership between the Northern Ohio Energy Storage Community, DOE and National Laboratories

Current Engineering Efforts – Lithium ion

- **Recyclability**

- With the recycling industry for lithium ion batteries still in its infancy, a variety of actors are also looking at how to optimize the **separation of lithium-ion battery components** at the battery's end-of-life.

PbA

Lithium

Northern Ohio Energy Storage and Integration Workshop

A Partnership between the Northern Ohio Energy Storage Community, DOE and National Laboratories

Current R&D Efforts – Automotive Fuel Cell

How fuel cell cars work

A fuel cell is a clean and efficient power plant that makes electricity through a chemical reaction between hydrogen and oxygen.

Electric motor

Propels the vehicle with little noise or vibration. It can also recover energy during deceleration.

Power control unit

Manages the fuel cell and the battery output and input in accordance with driving conditions.

Fuel port

The tanks are refilled at hydrogen fueling stations.

Battery

Hydrogen Tanks

Battery

Stores energy recovered during deceleration and helps during acceleration.

Power control unit

Fuel Cell stack

Motor

Safety measures

Sensors shut the valves of the tanks in cases of impact or leakage.

High-pressure hydrogen tanks

Provide hydrogen to the fuel cells.

Inside the fuel cell stack

Hundreds of individual fuel cells — each producing less than one volt — are assembled inside the stack to produce enough voltage for the motor.

Inside each cell, hydrogen passes through a negative electrode where a catalyst strips electrons from the atoms. The electrons flow from the negative to the positive electrode, generating electricity. Electrons and hydrogen atoms travel through an electrolyte membrane to reach the positive side, where they join with oxygen to become water.

JAVIER ZARRACINA Los Angeles Times

Northern Ohio Energy Storage and Integration Workshop

A Partnership between the Northern Ohio Energy Storage Community, DOE and National Laboratories

Current R&D Efforts – **Automotive Fuel Cell**

Advantages

- Water is the only discharge (pure H₂)
- Potential transition 2020+
- Japanese investment in market adoption
- Plays well in California

Disadvantages

- CO₂ discharged with methanol reform
- Little more efficient than alternatives
- Technology currently expensive
- Hydrogen often created using “dirty” energy (e.g. coal)
- Pure hydrogen is difficult to handle
 - Refilling stations, storage tanks
- Perception of “future technology”
- Limited number of suppliers

Northern Ohio Energy Storage and Integration Workshop

A Partnership between the Northern Ohio Energy Storage Community, DOE and National Laboratories

Opportunities for Ohio – **Already #2 or #3 in Auto Supply Chain**

Area

1. **Cell Chemistry (ies)**
2. **Cell Experience**
3. **Control Systems/Electronics**
4. **Recycling**
5. **PbA**
6. **Lithium Pack
Manufacturing/Integration**
7. **Reduce Time/Cost of product
validation testing**

Ohio Opportunity

1. Materials, Binders, Additives
2. NASA/Defense/Drones early users of emerging cell chemistries
3. Strong Supply Base (auto, commercial, industrial)
4. Design/Manufacturing for Recyclability; automotive recycling value chain
5. Continue leadership in PbA
6. Fill gap between OEMs and nameplate customers
7. In a world with increasing demands for more safety, durability and product validation

Northern Ohio Energy Storage and Integration Workshop

A Partnership between the Northern Ohio Energy Storage Community, DOE and National Laboratories

Future Opportunities for Ohio

Area

1. **Lightweight Materials**
2. **Form Factors (Design + Materials)**
3. **Intelligent vehicles**
4. **Fuel Cells**
5. **Reduce use of rare earth metals**
6. **BMS/Control Systems**

Ohio Opportunity

1. Migration of aluminum, lightweight steel, and performance plastics into vehicles and packs
2. Reduce volume, add other functional roles
3. Lower-cost, lower energy sensors and systems to maintain load levels
4. Because we are at NASA and someone here is thinking about it!
5. Issue across all the industries
6. Security in a remote, V2I, V2V world

Northern Ohio Energy Storage and Integration Workshop

A Partnership between the Northern Ohio Energy Storage Community, DOE and National Laboratories
